

nmcli examples (NetworkManager CLI)

ps -ef | grep examples (process inspection)

1. Find a running process by name

- **grep_process — ps -ef | grep sshd** Shows all sshd processes, including parent/child PIDs.

2. Filter out the grep process itself

- **grep_exclude_self — ps -ef | grep httpd | grep -v grep** Classic pattern to avoid matching the grep command.

3. Find processes owned by a specific user

- **grep_user_processes — ps -ef | grep "^bob"** Anchors the username at the start of the line.

4. Search for Java processes with a specific JAR

- **grep_java_jar — ps -ef | grep myapp.jar** Useful when multiple JVMs are running.

5. Find processes listening on a port (combined with netstat/ss)

- **grep_port_process — ps -ef | grep \$(ss -tulpn | grep :443 | awk '{print \$NF}' | cut -d',' -f2)** Extracts the PID from ss and matches it in ps.

6. Identify zombie processes

- **grep_zombies — ps -ef | grep " Z "** Looks for processes in the zombie state.

7. Find processes with long command lines

- **grep_long_cmd — ps -ef | grep -- "--config"** Useful when searching for processes started with specific flags.

Combined nmcli + ps troubleshooting examples

1. Check if NetworkManager is running

- **check_nm_running — ps -ef | grep NetworkManager | grep -v grep**

2. Verify DHCP client activity

- **check_dhcp — ps -ef | grep dhclient**
- Then confirm the interface: **nmcli device show eth0 | grep DHCP4**
